Global Factor Data Documentation

Theis Ingerslev Jensen, Bryan Kelly, and Lasse Heje Pedersen*

1 Overview

• This documentation describes the Global Factor Data, and the associated code for constructing the data, based on Jensen, Kelly, and Pedersen (2021). The citation for use of this data and code is:

Jensen, T.I., B. Kelly, and L.H. Pedersen (2021). "Is There a Replication Crisis in Finance?" Working Paper Yale University and Copenhagen Business School.

- The Global Factor Data includes 406 characteristics and their associated factor portfolios. This is a superset of the 153 factors analyzed in Jensen, Kelly, and Pedersen (2021).
- This documentation is grouped into eight main sections: Identifier Variables, Industry Identifiers, Helper Functions, Accounting Characteristics, Market Based Characteristics, Detailed Characteristic Construction, FX Conversion Rate Construction and Factor Details and Citations.
 - Identifier Variables include firm identifying information, date, etc...
 - Each of the Characteristics sections includes at least three subsections: Datasets,
 Variables, and Characteristics.
 - Datasets refers to which datasets the items in variables are drawn from. For example, 'COMP.FUNDA' suggests we use variables from the FUNDA dataset provided by Compustat.
 - Variables refers to a table containing information about the variables drawn from the datasets previously identified. These tables include the name, abbreviation used throughout the section, and the construction of the variables. These variables are constructed in a way to maximize coverage and are not directly included in the final dataset.

^{*}Jensen is at Copenhagen Business School. Kelly is at AQR Capital Management, Yale School of Management, and NBER; www.bryankellyacademic.org. Pedersen is at AQR Capital Management, Copenhagen Business School, and CEPR; www.lhpedersen.com. We are grateful to Tyler Gwinn for excellent research assistance. AQR Capital Management is a global investment management firm, which may or may not apply similar investment techniques or methods of analysis as described herein. The views expressed here are those of the authors and not necessarily those of AQR.

Characteristics refers to a table of constructed characteristics made of the previously describes variables. These tables include the name, the abbreviation used in the published dataset, and the construction. These characteristics are in the final dataset.

1.1 How To Run the Code

- Access the code for this data set at https://github.com/bkelly-lab/GlobalFactor.
- This data is produced using the SAS Studio on Wharton Research Data Services (WRDS) servers. The github README file contains instruction on how to generate the data.
- Use the 'EOM' (end of month) variable as the date variable to join/merge datasets.

1.2 How To Use the Data

- The *id* column is the unique security \times source¹ identifier.
- The *eom* column shows the end of month, where the data is valid. In other words, it shows the information available by the end of a given month. As an example, the *me* value for a stocks with *eom*=20191231, will be the last available market equity before or at December 31st 2019. When creating portfolio, characteristics should therefore be lagged relative to returns to avoid lookahead bias.
- The exentry column, identifies the country of the exchange where the security is traded.
- Suggested screens:
 - To obtain one observation per security \times month, use obs_main=1.
 - To obtain one observation per firm \times month, use primary_sec=1.
 - To include only common stocks, use *common*=1.
 - To include only main exchanges, use exch_main=1.

1.3 Versions, Bug Fixes, and Comments

- We will update the code and data regularly as CRSP and Compustat updates become available. We will also release periodic updates with bug fixes. Changes from periodic updates will be noted in the changelog: https://github.com/bkelly-lab/GlobalFactor/blob/master/CHANGELOG.md.
- The code and data has been carefully vetted, but may contain bugs and certainly has room for improvement. We welcome any and all feedback regarding bugs or suggestions for improvements and extensions.
- Send correspondence to bryan.kelly@yale.edu with subject "Global Factor Data"

 $^{^{1}}$ CRSP or Compustat.

1.4 Terminology

- Annual data refers to accounting data from annual reports sourced from COMP.FUNDA and COMP.G_FUNDA.
- Quarterly data refers to accounting data from quarterly reports sourced from COMP.FUNDQ and COMP.G.FUNDQ.
- Final Dataset refers to "world_data.sas7bdat", the output dataset
- Fiscal period refers to the relevant period over which income and expenses have accrued.
- Accounting variables refers to accounting items such as assets, sales and net income.
- Market variables refers to market based items such as market equity and excess return.
- <u>Characteristics</u> refers to columns in the final dataset such as asset growth, book to market equity, and net income to book equity.

2 Factor Portfolio Construction

- For each characteristic, we build the 1-month holding period factor return within each country as follows.
- In each country and month, we sort stocks into characteristic terciles (top/middle/bottom third) with breakpoints based on non-micro stocks in that country. Specifically, we start with all non-micro stocks in a country (i.e., larger than NYSE 20th percentile) and sort them into three groups of equal numbers of stocks based on the characteristic, say book-to-market. Then we distribute the micro-cap stocks into the three groups based on the same characteristic breakpoints. This process ensures that the non-micro stocks are distributed equally among across portfolios, creating more tradable portfolios.
- For each tercile, we compute its "capped value weight" return, meaning that we weight stocks by their market equity, winsorized at the NYSE 80th percentile. This construction ensures that tiny stocks have tiny weights and any one mega stock does not dominate a portfolio, seeking to create tradable, yet balanced, portfolios.
- The factor is then defined as the high-tercile return minus the low-tercile return, corresponding to the excess return of a long-short zero-net-investment strategy. The factor is long (short) the tercile identified by the original paper to have the highest (lowest) expected return.
- For a factor return to be non-missing, we require that it has at least 5 stocks in each of the long and short legs. We also require a minimum of 60 valid monthly observations for each country-specific factor for inclusion in our sample.

• We update characteristics with the most recent accounting data (which could be either annual or quarterly) starting four months after the reporting period.

3 Identifier Variables

This section covers all of the variables that give firm/date level identifiers and information. If a variable starts with 'comp' or 'crsp', then the following variable name is drawn from the specified dataset. For example, 'crsp_shrcd' is the 'shrcd' variable from CRSP.

Table 1: Identifier Variables

Name	Description
size_grp	This groups each firm into one of five categories: Mega, Large, Small, Micro and Nano cap. The groups are non-overlapping and the breakpoints are based on the market equity of NYSE stocks. In particular, Mega caps are all stocks with market equity larger than the 80th percentile of NYSE stocks, Large caps are all remaining stocks larger than the 50th percentile, Small caps are larger than the 20th percentile, Micro caps are larger than the 1st percentile and Nano caps are the remaining stocks. Dataset's unique firm identifier variable. It first identifies the source of the data 'crsp' or 'comp' and also a
id	number as a firm identifier.
source	Identifies the source of the firm/date observation which is either CRSP or Compustat
obs_main	If there are more than one firm observations for one date, this identifies if the observation is considered as the 'main' observation. If available, CRSP observations are considered as the 'main' observation. Indicator for main exchanges. If CRSP is the source, main exchanges are those with $crsp_exchcd$ 1, 2 and 3.
exch_main gvkey	If Compustat is the source, main exchanges are all <i>comp_exchg</i> except 0, 1, 2, 3, 4, 13, 15, 16, 17, 18, 19, 20, 21, 127, 150, 157, 229, 263, 269, 281, 283, 290, 320, 326, 341, 342, 347, 348, 349, 352. Permanent six-digit unique firm identifier from Compustat
iid	Permanent two-digit addition to 'gykey' that identifies specific issues of a firm from Compustat
primary_sec	Primary security as identified by Compustat. A 'gvkey' can have up to three different primary securities ('iid)' at a given time (US, CA, and international). When Compustat data is missing, we use permco as the company identifier and let the primary security be the one with the highest trading volume. Permanent unique firm identifier from CRSP
permco	Permanent issue identifier from CRSP
exentry	The country of the exchange where the security is traded. Usually expressed as an ISO currency code with the exception of <i>mul</i> which indicates a multi country exchange ² Currency of <i>prc_local</i> and the currency used to calculated <i>ret_local</i> .
fx	Ratio of curcd to USD at the date of observation
common	Indicator for common stocks. If CRSP is the source, common is one if the SHRCD variable is 10, 11 or 12. If Compustat is the source, common is one if TPCI is '0' Compustat issue type identifier
crsp_shrcd	CRSP share code
comp_exchg	Compustat stock exchange code
crsp_exchd	CRSP stock exchange code
date	Date of the last observation during the month.
eom	The last day of the month in which the observation is made
adjfct	Share adjustment factor, using 'cfacshr' if the source is CRSP or 'ajexdi' if the source is Compustat

4 Industry Identification

This section describes the industry identifiers. First we contruct separate identifiers for CRSP and Compustat. Based on these datasets, we create one SIC, NAICS and GICS code

²Typically over the counter exchanges.

for each firm based on Compustat data if available and otherwise CRSP. GVKEY is the company identifier for COMPUSTAT. PERMNO is the security identifier for CRSP. While we would prefer to use PERMCO, which is company level, different firms with different industry identifications can be listed under the same PERMCO. CRSP identifiers are available on a daily basis. For Compustat, we extract SIC and NAICS codes from annual accounting reports. Historical GICS codes are only available in Compustat. The Fama-French industry identifier is mapped from SIC codes using documentation provided by Ken French. We allow for using either 38 or 49 industry portfolio definitions, as defined here and here, respectively. By default, we use the 49 portfolio definition, but that can be adjusted in 'main.sas'.

4.1 Datasets

- CRSP.DSENAMES
- COMP.FUNDA
- COMP.G_FUNDA
- COMP.CO_HGIC
- COMP.G_CO_HGIC

Table 2: Identifier Variables

Name	Description
sic	Firm SIC industry. We use Compustat data if available and otherwise use CRSP data.
naics	Firm NAICS industry. We use Compustat data if available and otherwise use CRSP data.
gics	Firm GICS industry. We use historical data from Compustat.
ff49	Classification of stocks into 49 industry groups based SIC codes and the methodology in Fama and French (1997) with the addition of a software industry.

5 Helper Functions

This section describes functions that we use to create variables. Many of the functions are used for variables with quarterly, monthly and daily frequencies, and these are specified by "_zQ", "_zM" and "_zD" respectively, where "z" is the number of quarters, months or days that the function is referencing. For example, COVAR_12M(X, Y) is the covariance of variables X and Y over the past 12 months.

Table 3: Helper Functions

Function	Name	Description
Mean	\overline{X}_z	$\frac{1}{z} \sum_{n=0}^{z-1} X_{t-n}$
Variance	VARC_z(X)	$\frac{1}{z-1} \sum_{n=0}^{z-1} (X_{t-n} - \overline{X_{t}}_z)^2$
Covariance	$COVAR_z(X, Y)$	$\frac{1}{z-1} \sum_{n=0}^{z-1} (X_{t-n} - \overline{X_{t}}_z) (Y_{t-n} - \overline{Y_{t}}_z)$

Function	Name	Description		
Standard Deviation	$\sigma_z(X)$	$\sqrt{VARC.z(X)}$		
Skewness	SKEW_z(X)	$\frac{1}{z \times \sigma_z(X)^3} \sum_{n=0}^{z-1} (X_{t-n} - \overline{X_{tz}})^3$		
Standardized Unexpected Realization	$SUR_z(X)$	$\frac{X_{t} - (X_{t-3} + \overline{(X_{t-3} - X_{t-15})}_{z}/4)}{\sigma_{z}(X_{t-3} - X_{t-15})}$		
Change to Expectations	CHG_TO_EXP(X)	$\frac{X_t}{(X_{t-12} + X_{t-24})/2}$		
Maximum	MAXn_z(X)	The maximum n values of given input.		
Quality Minus Junk Variables				
Earnings Volatility	_EVOL	$ROEQ_BE_STD \times 2$. If this is unavailable, we use ROE_BE_STD .		
Rank of Variable	$_{ extstyle -}rVar$	Cross-sectional rank of Var within a country ³		
Z transformation	ZV(rVar)	$\frac{ _rVAR - \overline{_rVAR}_z}{ _t(_rVAR)}$		

6 Accounting Characteristics

6.1 Datasets

- COMP.FUNDA
- COMP.FUNDQ
- COMP.G_FUNDA
- COMP.G_FUNDQ

6.2 General Information

- We create characteristics for annual and quarterly accounting data separately. We then take the most recent characteristics value from each dataset to create the final dataset.
- We assume that accounting variables are publically available 4 months after the end of the accounting period .
- In describing accounting variables, we use the Compustat item names from the annual dataset. The equivalent item name in the quarterly dataset can be found by adding a 'q' or 'y' to the end of the annual item name. Specifically, 'q' indicates a value calculated over one quarter while 'y' refers to the cumulative value over the quarters with data available within a fiscal year.

 $^{^3}OACCRUALS_AT,~BETABAB_1260d,~DEBT_AT$ and $_EVOL$ are sorted in descending order. All other variables are sorted in ascending order.

6.3 Annualized Accounting Variables from Quarterly Data

- The value of a balance sheet item such as asset or book equity has the same meaning in the annual and the quarterly data. It is the value by the end of a fiscal period.
- The value of an income or cash flow statement item is different. In the annual data, it is calculated over one year. However, in the quarterly data, it is calculated over one quarter. To make quarterly income and cash flows items comparable to the corresponding annual item, we take the sum of the item over the last four quarters.

6.4 Accounting Variables

The abbreviation is used to refer to the accounting variable. A suffix of '*' indicates that we have altered the original Compustat item to increase the coverage or to create a variable that is a part of creating a characteristic in the final dataset. The characteristic name will reflect the accounting name except the '*' suffix. As an example, 'gp_at' is gross profit scaled by assets. In general, we will refer to Compustat variables using capital letters.

Table 4: Accounting Variables

Name	Abbreviation	Construction	
Income Statement			
Sales	sale*	We prefer SALE. If this is unavailable, we use REVT	
Cost of Goods Sold	cogs	Compustat item COGS	
Gross Profit	gp^*	We prefer to use GP. If this is unavailable we use sale*-COGS	
Selling, General and Administrative Expenses	xsga	Compustat item XSGA	
Advertising Expenses	xad	Compustat item XAD. Note that this is not available in Compustat Global	
Research and Development Expenses	xrd	Compustat item XRD. Note that this is not available in Compustat Global	
Staff Expenses	xlr	Compustat item XLR	
Special Items	spi	Compustat item SPI	
Operating Expenses	opex*	We prefer to use XOPR. If this is unavailable, we use COGS+XSGA	
Operating Income Before Depreciation	ebitda*	We prefer to use EBITDA. If this is unavailable, we use OIBDP. If this is unavailable, we use SALE*-OPEX*. If this is unavailable, we use GP*-XSGA	
Depreciation and Amortization	dp	Compustat Item DP	
Operating Income After Depreciation	ebit*	We prefer to use EBIT. If this is unavailable, we use OIADP. If this is unavailable, we use EBITDA*-DP	
Interest Expenses	int	Compustat item XINT	
Operating Profit ala Ball et al (2015)	op*	We use EBITDA* + XRD . If XRD is unavailable, we set it to zero	
Operating Profit to Equity	ope*	We use EBITDA*-XINT. Note that we target the same variable as the numerator of the profitability characteristic used to create the Robust-minus weak factor in the fama-French 5 factor model (Fama and French, 2015)	
Earnings before Tax and Extraordinary Items	pi*	We prefer to use PI. If this is unavailable we use EBIT*-XINT+SPI+NOPI where we set SPI and NOPI to zero if missing	
Income Tax	tax	Compustat item TXT	
Extraordinary Items and Discontinued Operations	xido*	We prefer to use XIDO. If this is unavailable, we use XI+DO where we set DO to zero if missing. The reason why we set missing DO to zero is because it is not available in COMP.G_FUNDQ	
Net Income	ni*	We prefer to use IB. If this is unavailable, we use NI-XIDO*. If this is unavailable, we prefer PI*-TXT-MII. If MII is unavailable, it is set to zero	

Name	Abbreviation	Construction
Net Income Including Extraordinary	• *	We prefer NI. If this is not available, we prefer NI*+XIDO*. If
Items	nix*	XIDO* is unavailable, we set it to zero. If that is unavailable, we prefer NI*+XI+DO
Firm Income	fi*	We use NIX*+XINT
Dividends for Common Shareholds	dvc	Compustat Item DVC
Total Dividends	div*	We prefer DVT. If this is not available, we use DV
Income Before Extraordinary Items	$_{ m ni_qtr}^*$	We use IBQ
Net Sales	sale_qtr*	We use SALEQ
Conital Franco dituna		ow Statement Compustat item CAPX
Capital Expenditures Capital Expenditures to Sales	capx capex_sale*	We use CAPX / SALE*
Capital Expenditures to Sales	сарскъвае	We use OCF*-CAPX. Note that the free cash flow is com-
Free Cash Flow	fcf*	puted before financing activities and sale of assets is taken
		into account
F : D 1 1	114	We use PRSTKC+PURTSHR Equity Buyback is mainly
Equity Buyback	eqbb*	PRSTKC in NA and PURTSHR in GLOBAL. Either of
Equity Issuance	egis*	PRSTKC or PURTSHR are allowed to be missing Compustat item SSTK
1	-	We use EQIS*-EQBB*. Either EQIS* or EQBB* are allowed
Equity Net Issuance	eqnetis*	to be missing
Net Equity Payout	eqpo*	We use DIV*+EQBB*
Equity Net Payout	eqnpo*	We use DIV*-EQNETIS*
		We prefer to use DLTIS-DLTR where we only require that
Net Long-Term Debt Issuance	dltnetis*	one of the items are non-missing. If this is unavailable, we use LTDCH. If this is unavailable we use the yearly change in
		long-term book debt DLTT
Not Chart Town Dalt Issues	dstnetis*	We prefer DLCCH. If this is unavailable, we use the yearly
Net Short-Term Debt Issuance	dstnetis"	change in short-term book debt DLC
Net Debt Issuance	dbnetis*	We use DLTNETIS*+DSTNETIS* and only require one of
1100 Bost Issuance	abiletis	the items to be non-missing
Net Issuance	netis*	We use EQNETIS*+DBNETIS*. Either EQNETIS* or DBNETIS* are allowed to be missing
		We prefer FINCF. If this is unavailable, we use NETIS*-
Financial Cash Flow	fincf*	DV+FIAO+TXBCOF. If FIAO or TXBCOF is missing, it
		is set to zero
	Balance	Sheet - Assets
T . 1 . 4	. *	We prefer to use AT. If this is unavailable, then we use SEQ*
Total Assets	at*	+ DLTT + LCT + LO + TXDITC. If LCT, LO, or TXDITC are missing, then they are set to zero
		We prefer ACT. If this is unavailable, we use
Current Assets	ca*	RECT+INVT+CHE+ACO
Account Receivables	rec	Compustat item RECT
Cash and Short-Term Investment	cash	Compustat item CHE
Inventory	inv	Compustat item INVT
Non-Current Assets Intangible Assets	nca*	We use AT* - CA* Compustat item INTAN
Intangible Assets Investment and Advances	intan ivao	Compustat item INTAN Compustat item IVAO
Property, Plans and Equipment Gross	ppeg	Compustat item PPEGT
Property, Plans and Equipment Net	ppen	Compustat item PPENT
		heet - Liabilities
Total Liabilities	lt	Compustat item LT
Current Liabilities	cl*	We prefer LCT. If this is unavailable, we use AP+ DLC+ TXP+ LCO
Accounts Payable	ap	Compustat item AP
Short-Term Debt	debtst	Compustat item DLC
Income Tax Payable Non-Current Liabilities	$^{ m txp}_{ m ncl}{}^*$	Compustat item TXP We use LT-CL*
Long-Term Debt	debtlt	Compustat item DLTT
Ü		We prefer to use TXDITC. If this is unavailable, we use
Deferred Taxes and Investment Credit	txditc*	TXDB+ ITCB
	Balance S	heet - Financing
Preferred Stock	pstk*	We prefer to use PSTKRV. If this is unavailable, we use PSTKL. If this is unavilable, we use PSTK
Total Debt	debt*	We use DLTT+ DLC. Either DLTT or DLC are allowed to
		me missing
Net Debt	netdebt*	We use DEBT*- CHE where we set CHE to zero if missing

Name	Abbreviation	Construction

Operating Cash Flow to Assets 5 yr Change	cfoa_ch5	$rac{OCF^*_{\ \ t}}{AT^*_{\ t}} - rac{OCF^*_{t-60}}{AT^*_{t-60}}$
Gross Product to Sales 5 yr Change	gmar_ch5	$\frac{GP_{t}^{*}}{SALE_{t}^{*}} - \frac{GP_{t-60}^{*}}{SALE_{t-60}^{*}}$
New Variables from HXZ		
Cash and Short Term Investments scaled by Assets	cash_at	$\frac{CASH_t}{AT^*_t}$
Number of Consecutive Earnings Increases	ni_inc8q	Count number of earnings increases over past 8 quarters
Change in Property, Plant and Equipment Less Inventories scaled by lagged Assets	ppeinv_gr1a	$\frac{PPEINV*_{t}-PPEINV*_{t-12}}{AT*_{t-12}}$
Change in Long-Term NOA scaled by average Assets	lnoa_gr1a	$\frac{LNOA^*_{t}-LNOA^*_{t-12}}{AT^*_{t}-AT^*_{t-12}}$
CAPX 1 year growth	capx_gr1	$\frac{CAPX_t}{CAPX_{t-12}} - 1$
CAPX 2 year growth	capx_gr2	$\frac{CAPX_t}{CAPX_{t-24}} - 1$

Name	Abbreviation	Construction
CAPX 3 year growth	capx_gr3	$\frac{CAPX_t}{CAPX_{t-36}} - 1$
Change in Short-Term Investments scaled by Assets	sti_gr1a	$\frac{IVST_t - IVST_{t-12}}{AT^*_t}$
Quarterly Income scaled by BE	niq_be	$\frac{NI_QTR^*_{t}}{BE^*_{t-3}}$
Change in Quarterly Income scaled by BE	niq_be_chg1	$NIQ_BE_t - NIQ_BE_{t-12}$
Quarterly Income scaled by AT	niq_at	$\frac{NI_QTR^*_t}{AT^*_{t-3}}$
Change in Quarterly Income scaled by AT	niq_at_chg1	$NIQ_AT_t - NIQ_AT_{t-12}$
Quarterly Sales Growth	saleq_gr1	$\frac{SALE_QTR^*_t}{SALE_QTR^*_{t-12}} - 1$
R&D Capital-to-Assets	rd5_at	$\frac{\sum_{n=0}^{4} (12 \times n) (XRD_{t-12*n})}{AT^*_{t}}$
Age	age	Age of the firms in months
Change Sales minus Change Inventory	dsale_dinv	$CHG_TO_EXP(SALE^*_t) - CHG_TO_EXP(INV_t)$
Change Sales minus Change Receivables	dsale_drec	$CHG_TO_EXP(SALE^*_t) - CHG_TO_EXP(REC_t)$
Change Gross Profit minus Change Sales	dgp_dsale	$CHG_TO_EXP(GP^*_t) - CHG_TO_EXP(SALE^*_t)$
Change Sales minus Change SG&A	$dsale_dsga$	$CHG_TO_EXP(SALE^*_t) - CHG_TO_EXP(XSGA_t)$
Earnings Surprise	saleq_su	$SUR(SALE_QTR^*)$
Revenue Surprrise	niq_su	$SUR(NI_QTR^*)$
Total Debt scaled by ME	debt_me	$\frac{DEBT^*_t}{ME_t}$
Net Debt scaled by ME	netdebt_me	$\frac{NETDEBT^*_t}{ME_t}$
Abnormal Corporate Investment	capex_abn	$\frac{{{CAPX}_SALE}^*_t}{{({CAPX}_SALE}^*_{t-12} + {CAPX}_SALE}^*_{t-24} + {CAPX}_SALE}^*_{t-36})/3} - 1$
Inventory Change 1 yr	inv_gr1	$\frac{INV_t}{INV_{t-12}} - 1$
Book Equity Change 1 yr scaled by Assets	be_gr1a	$\frac{BE_{t}^{*}-BE_{t-12}^{*}}{AT_{t}^{*}}$
Ball Operating Profit to Assets	op_at	$\frac{OP_t^*}{AT_t^*}$
Earnings before Tax and Extraordinary Items to Net Income Including Extraordinary Items	pi_nix	$\frac{PI^*_t}{NIX^*_t}$
Ball Operating Profit scaled by lagged Assets	op_atl1	$\frac{OP^*_t}{AT^*_{t-12}}$
Operating Profit scaled by lagged Book Equity	ope_bel1	$\frac{OPE_{t}^{*}}{BE_{t-12}^{*}}$
Gross Profit scaled by lagged Assets	gp_atl1	$\frac{GP^*_t}{AT^*_{t-12}}$
Cash Based Operating Profitability scaled by lagged Assets	cop_atl1	$\frac{COP_{t}^{*}}{AT_{t-12}^{*}}$
Book Leverage	at_be	$\frac{AT^*_t}{BE^*_t}$
Operating Cash Flow to Sales Quarterly Volatility	ocfq_saleq_std	$\sigma_{16Q}\left(rac{OCF_QTR^*_t}{SALE_QTR^*_t}) ight)$
Liquidity scaled by lagged Assets	aliq_at	$\frac{ALIQ^*_{t}}{AT^*_{t-12}}$
Liquidity scaled by lagged Market Assets	aliq_mat	$\frac{ALIQ^*_{t}}{MAT^*_{t-12}}$

Name	Abbreviation	Construction
Tangibility	tangibility	$\frac{CASH_t + 0.715 \times REC_t + 0.547 \times INV_t + 0.535 \times PPEG_t}{AT^*_t}$
Equity Duration	eq_dur	Outlined in detail here

8.2 Market Variables

The abbreviation is used to refer to the market variable. A suffix of '*' indicates that we have altered the original CRSP item to increase the coverage.

Table 6: Market Variables

Name	Abbreviation	Construction	
${f CRSP\ Variables}^5$			
Share Adjustment Factor	adjfct*	We use CFACSHR	
Shares	shares*	We use SHROUT/1000 so shares outstanding are in millions.	
Price	prc*	We use PRC	
Local Price	prc_local*	We use PRC*	
Highest Daily Price/Ask	prc_high	We use ASKHI. If PRC* or AKSHI are negative, then PRC_HIGH is set to missing	
Lowest Daily Price/Bid	prc_low	We use BIDLO. If PRC* or BIDLO are negative, then PRC_LOW is set to missing	
Adjusted Proce	prc_adj*	We use PRC*×ADJFCT*	
Market Equity	me*	We use PRC*×SHARES* so market equity is quoted in million USD.	
Company Market Equity	me_company*	We sum ME* grouped by PERMNO and date	
Dollar Volume	dolvol*	We use VOL×PRC*	
Return	RET*	We use RET	
Local Return	ret_local*	We use RET	
Excess Return	ret_exc*	We use (RET*-T30RET)/21. If T30RET is unavailable, we use RF. If the return is a daily return rather than a monthly return, the RET - T30RET is divided by 1 rather than 21.	
Excess Return t+1	ret_exc_lead1m*	Excess return (ret_exc*) in month t+1	
Time Since Most Recent Return	ret_lag_dif*	We automatically set this to 1	
Cumulative Return	ri*	This is the cumulative return estimated from RET*	
Monthly Dividend	div_tot*	We use $(RET - RETX) \times lag(PRC^*) \times (CFACSHR/lag(CFACSHR))$	
		at Variables	
Share Adjustment Factor	adjfct*	We use AJEXDI	
Shares	shares*	We use CSHOC/1000000	
Price	prc*	We use PRC_LOCAL*×FX ⁶	
Local Price	prc_local*	We use PRCCD	
Market Equity	me*	We use PRC*×SHARES*	
Company Market Equity	me_company*	We use ME*	
Dollar Volume	dolvol*	We use CSHTRD×PRC*	
Return	RET*	We use RET_LOCAL*×FX	

 $[\]overline{}^{5}$ lag is a lag function where lag(x) is the value of x from the previous time period

 $^{^6{\}rm FX}$ scales the price to USD

Name	Abbreviation	Construction
		We use (RET*-T30RET)/21. If T30RET is unavailable, we
Excess Return	ret_exc*	use RF. If the return is a daily return rather than a monthly
		return, the RET - T30RET is divided by 1 rather than 21.
Excess Return t+1	ret_exc_lead1m*	Excess return (ret_exc*) in month t+1
Cumulative Return - Local	ri_local*	We use PRC_LOCAL * \times TRFD/AJEXDI
Local Return	ret_local*	We use RI_LOCAL*/ $lag(RI_LOCAL^*) - 1$
		We estimate the number of days since the previous return. If
Time Since Most Recent Return	ret_lag_dif*	the returns are monthly rather than daily, then the time is in
		months
Cumulative Return	ri*	$RI_LOCAL^* \times FX^*$
Monthly Dividend	div_tot*	We use DIV \times FX*. If DIV is missing, we set it to zero
Cash Dividend	div_cash*	We use $\overline{\text{DIVD}} \times \text{FX}^*$. If $\overline{\text{DIVD}}$ is unavailable, we set it to
Cash Dividend	div zedeli	zero
Special Cash Dividend	div_spc*	We use $\overline{\text{DIVSP}} \times \text{FX}^*$. If $\overline{\text{DIVSP}}$ is unavailable, we set it to
•	1	zero
Bid-Ask Average Dummy	bidask*	When $PRCSTD = 4$ then 1, otherwise 0
		icing Factors
Excess Market Return	mktrf*	Country specific market return
		Country specific factor following Fama and French (1993) and
High Minus Low	hml*	using breakpoints from non-micro cap stocks within the coun-
		try
Small Minus Big ala Fama-French	smb_ff*	Average of small portfolios minus average of large portfolios
		from hml*
		Country specific factor following Hou, Xue and Zhang (2015)
D	*	and using breakpoints from non-micro cap stocks within the
Return on Equity	roe*	country. We use double sorts on return on equity and size
		rather than triple sorts with investment, due to the limited
		number of stocks in some international markets.
		Country specific factor following Hou, Xue and Zhang (2015)
Investment	inv*	and using breakpoints from non-micro cap stocks within the
Investment	IIIV.	country. We use double sorts on investment and size rather
		than triple sorts with return on equity, due to the limited number of stocks in some international markets
Small Minus Big ala Hou et al	smb_hxz*	Average of small portfolios minus average of large portfolios from roe* and inv*
Market Volatility for Each Stock	_mktvol_zd*	from roe and inv $\sigma_{zD}(MKTRF^*_t)^7$
Market Volatility for Pacif Stock	_IIIKUVUI_ZU	0 zD(1/11 1 1 1 1 t)

Table 7: Market Characteristics

Name	Abbreviation	Construction
	Size Base	ed Measures

⁸A rank characteristic has the value of that characteristics rank with respect to other companies' same characteristic of the same month and country scaled [0, 1]. This is identified with a "r01" superscript.

⁹Many of the variables in this section are estimated using rolling windows of data, and the variables are estimated using a variety of window lengths: 21, 126, 252 and 1260 days. In this section, I refer to the number of days as m as a proxy for any of the possible window lengths.

Name	Abbreviation	Construction
Amihud (2002) Measure	ami_zd	$\left(\frac{ RET^*_t }{DOLVOL^*_t}\right)_{zD}$ * 1000000

Name	Abbreviation	Construction
Quality Minus Junk	qmj	$\frac{QMJ_PROF_t + QMJ_GROWTH_t + QMJ_SAFETY_t}{3}$

9 Detailed Characteristic Construction

This section includes detailed descriptions how we built characteristics that don't easily fit into the Accounting Characteristics or Market Characteristics tables.

• Equity Duration

- Define the following variables:
 - * horizon: number of months used to estimate helper variables
 - * r: constant used as assumed discount rate
 - * roe_mean: constant used as the average ROE value
 - * roe_ar1: constant used as the expected growth rate of ROE
 - * g_mean: constant used as the average sales growth rate
 - * g_ar1: constant used as the expected growth rate of sales
- Create initial variables:

- * If the number of non-missing observations is less than or equal to 12 or the variables' respective denominators are less than or equal to 1 $_roe0_t$ and $_g0_t$ are set to missing.
- Forecast cash distributions

$$roe_c = roe_mean \times (1 - roe_ar1)$$

$$g_c = g_mean \times (1 - g_ar1)$$

$$_roe_t = \sum_{i=1}^{horizon} roe_c + roe_ar1 \times _roe_{t-i}$$

$$_g_t = \sum_{i=1}^{horizon} g_c + g_ar1 \times _g_{t-i}$$

$$_be_t = \sum_{i=1}^{horizon} _be_{t-i} \times (1 + _g_t)$$

$$_cd_t = \sum_{i=1}^{horizon} _be_t \times (_roe_t - _g_t)$$

- Create duration helper variables ¹¹

$$ed_constant = horizon + \frac{1+r}{r}$$

$$ed_cw_w_t = \sum_{i=1}^{horizon} ed_cd_w_{i-1} + i \times \frac{_cd_t}{(1+r)^i}$$

$$ed_cd_t = \sum_{i=1}^{horizon} ed_cd_{i-1} + \frac{_cd_t}{(1+r)^i}$$

- Characteristic:

$$eq_dur_t = \frac{ed_ed_w_t \times FX_t}{ME_COMPANY_t} + ed_constant \times \frac{ME_COMPANY_t - ed_cd_t \times FX_t}{ME_COMPANY_t}$$

• Piotroski F-Score

- Create helper variables:

$$-f_roa_t = \frac{NI^*_t}{AT^*_{t-12}}$$

$$-f_croa_t = \frac{OCF^*_t}{AT^*_{t-12}}$$

$$-f_droa_t = -f_roa_t - -f_roa_{t-12}$$

$$-f_acc_t = -f_croa_t - -f_roa_t$$

$$-f_lev = \frac{DLTT_t}{AT^*_t} - \frac{DLTT_{t-12}}{AT^*_{t-12}}$$

$$-f_liq_t = \frac{CA^*_t}{CL^*_t} - \frac{CA^*_{t-12}}{CL^*_{t-12}}$$

$$-f_eqis_t = EQIS^*_t$$

$$-f_gm_t = \frac{GP^*_t}{SALE^*_t} - \frac{GP^*_{t-12}}{SALE^*_{t-12}}$$

$$-f_aturn_t = \frac{SALE^*_t}{AT^*_{t-12}} - \frac{SALE^*_{t-12}}{AT^*_{t-24}}$$

* For all variables except $_f_acc$, $_f_aturn$ $_f_eqis$, if the count of available observations is less than or equal to 12, then the variable is set to missing. If $_f_aturn$ has less than or equal to 24 non-missing observations, it is set to missing. If a variable has AT^*_t or AT^*_{t-12} as an input and $AT^*_t <= 0$ or $AT^*_{t-12} <= 0$, then it is set to missing. If $CL^*_t <= 0$ or $CL^*_{t-12} <= 0$ then $_f_liq_t$ is set to missing. If $SALE^*_t <= 0$ or $SALE^*_{t-12} <= 0$ then $_f_gm_t$ is set to missing.

 $^{^{11}}ed_cw_w$, ed_cd and ed_err are equal to 0 at i = 1. ed_cw_w and ed_cd recusrively build upon themselves over the length of the horizon, so $ed_cw_w_{i-1}$, for example, would be the previous iteration of ed_cw_w

- Characteristic¹²

$$f_score_t = _f_roa_{>0,t} + _f_croa_{>0,t} + _f_droa_{>0,t} + _f_acc_{>0,t} + \\ _f_lev_{<0,t} + _f_liq_{>0,t} + _f_eqis_{=0,t} + _f_gm_{>0,t} + _f_aturn_{>0,t}$$

• Ohlson O-Score

- Create helper variables:

- * If $AT^*_t <= 0$, then $_o_lat_t$, $_o_lev_t$, $_o_wc_t$, and $_o_roe_t$ are set to missing. If $CA^*_t <= 0$ then $_o_cacl_t$ is set to missing. If $LT_T <= 0$ then $_o_ffo_t$ is set to missing. If LT_t or AT^*_t are missing, then $_o_neg_eq_t$ is set to missing. If there are less than or equal to 12 observations or either of NIX^*_t and NIX^*_{t-12} are missing, then $_o_nich_t$ and $_o_neg_earn_t$ are set to missing.
- Characteristic:

$$o_score_t = -1.37 - 0.407 \times _o_lat_t + 6.03 \times _o_lev_t + 1.43 \times _o_wc_t + 0.076 \times _o_cacl_t - 1.72 \times _o_neg_eq_t - 2.37 \times _o_roe_t - 1.83 \times _o_ffo_t + 0.285 \times _o_neg_earn_t - 0.52 \times _o_nich_t$$

• Altman Z-Score

 $^{^{12}}$ A subscript of > 0, ex: $VAR_{t>0,t}$, is a dummy for if the variable is greater than zero, and it is defined similarly for $VAR_{t<0,t}$ or any other specification. Otherwise, not included as an input, Also, if any variables other than f-eqis_t are missing, then f-score_t is set to missing.

- Create helper variables:

$$z_{-}wc_{t} = \frac{CA^{*}_{t} - CL^{*}_{t}}{AT^{*}_{t}}$$

$$z_{-}re_{t} = \frac{RE_{t}}{AT^{*}_{t}}$$

$$z_{-}eb_{t} = \frac{EBITDA^{*}_{t}}{AT^{*}_{t}}$$

$$z_{-}sa_{t} = \frac{SALE^{*}_{t}}{AT^{*}_{t}}$$

$$z_{-}me_{t} = \frac{ME_{-}FISCAL_{t}}{LT_{t}}$$

- * If $AT^*_t = < 0$ then any variable including AT^*_t , then it is set to missing. If $LT_t = < 0$, then $_z me_t$ is set to missing.
- Characteristic:

$$z_score_t = 1.2 \times _z_wc_t + 1.4 \times _z_re_t + 3.3 \times _z_eb_t + 0.6 \times _z_me_t + 1.0 \times _z_sa_t$$

- Kaplan-Zingales Index
 - Create helper variables:

- * If the number of non-missing observations is less than or equal to 12, then $_kz_cf_t$, $_kz_dv_t$ and $_kz_cs_t$ are set to zero. If $PPENT_{t-12} <= 0$ then $_kz_cf_t$, $_kz_dv_t$ and $_kz_cs_t$ are set to missing. If $AT^*_t <= 0$ then $_kz_q_t$ is set to missing. If $(DEBT^*_t + SEQ^*_t) = 0$ then $_kz_db_t$ is set to missing.
- Characteristic:

 $kz_index = -1.002 \times _kz_cf_t + 0.283 \times _kz_q_t + 3.139 \times _kz_db_t - 39.368 \times _kz_dv_t - 1.315 \times _kz_cs_t$

- Intrinsic ROE from Frankel and Lee
 - Define r as a constant assumed discount rate

- Create helper variables:

* If $NIX^*_t \le 0$ then

$$iv_po_t = \frac{DIV^*_t}{AT^*_t \times 0.06}$$

- * If the number of non-missing observations is less than or equal to 12 or $(BE^*_t + BE^*_{t-12}) \le 0$ then $_iv_roe_t$ is set to missing.
- Characteristics:

$$intrinsic_value_t = BE*_t + \frac{_iv_roe_t - r}{1 + r} \times BE*_t + \frac{_iv_roe_t - r}{(1 + r) \times r} \times _iv_be1_t$$

- * If $intrinsic_value_t \le 0$ then it is set to missing.
- Net Income Idiosyncratic Volatility
 - Define the following variable ¹³:

*

$$_{n}i_{-}at_{t} = \frac{NI^{*}_{t}}{AT^{*}_{t}}$$

- A rolling regression of the following form is run for each company, with the time series split up into n groups:

*

$$_ni_at_t = \beta_0 + \beta_1 ni_at_{t-12} + u_t$$

where edf_t = the error degrees of freedom of regression and $rmse_t$ = root mean square error of the regression.

- Characteristic:

$$ni_ivol_t = \sqrt{\frac{rmse_t^2 \times edf_t}{edf_t + 1}}$$

• Beta, Idiosyncratic Volatility and Skewness of Asset Pricing Factor Regressions

¹³If AT^*_t ; 0, then $_ni_at_t$ is set to missing

- This section describes the construction of beta_zd for the CAPM model, and the idiosyncratic volatility and skewness characteristics, which are estimated using three different factor models:
 - * CAPM (capm):

$$RET_{-}EXC^*_{t} = \beta_0 + \beta_1 MKTRF^*_{t} + \epsilon_t$$

* Fama-French 3 Factor Model (ff3):

$$RET_{-}EXC^*_{t} = \beta_0 + \beta_1 MKTRF^*_{t} + \beta_2 HML^*_{t} + \beta_3 SMB_{-}FF^*_{t} + e_t$$

* Hou, Xue and Zhang 4 Factor Model (hxz4):

$$RET_{-}EXC^*_{t} = \beta_0 + \beta_1 MKTRF^*_{t} + \beta_2 SMB_{-}HXZ^*_{t} + \beta_3 ROE^*_{t} + \beta_4 INV^*_{t} + \mu_t$$

- Characteristics ¹⁴:

$$beta_zd = \beta_1 \text{ from the CAPM model}$$

$$ivol_capm_zd_t = \sigma_{zD}(\epsilon_t)$$

$$ivol_ff3_zd_t = \sigma_{zD}(e_t)$$

$$ivol_hxz4_zd_t = \sigma_{zD}(\mu_t)$$

$$iskew_capm_zd_t = SKEW_zD(\epsilon_t)$$

$$iskew_ff3_zd_t = SKEW_zD(e_t)$$

$$iskew_hxz4_zd_t = SKEW_zD(\sigma_t)$$

• Downside Beta

- Define the following regression model run over z days:

$$RET_{-}EXC^*_{t} = \beta_0 + \beta_1 MKTRF^*_{t} + \epsilon_t$$

However, we restrict the data to when $MKTRF^*$ is negative.

- Characteristic:
 - * $betadown_{-}zd = \beta_1$

10 FX Conversion Rate Construction

This section outlines how we create a daily dataset, beginning 01/01/1950 to now, of X currency - USD exchange rate using COMPUSTAT. This is run in the macro $compustat_f x()$ in the $project_macros.sas$ file.

• We use COMP.EXRT_DLY, which has daily conversion rates from GBP to other currencies 'X'.

 $^{^{14}}z$ indicates over how many days the model is run.

 \bullet Every day available, we estimate the exchange rate fx_t as

$$fx_t = \frac{USD_{GBP,t}}{X_{GBP,t}}$$

where $X_{GBP,t}$ is the exchange rate of GBP to currency X on day t.

- In case there are gaps in information, we assume the exchange rate of the last observation until a new observation is available.
- $\bullet \ fx_t$ is quoted as $\frac{X_t}{USD_t}$, so to go from X to USD, do $X_t \times fx_t$

11 Factor Details and Citations

Note: This table shows cluster names as underlined section headings and, for each cluster, a description of the factors included, the variable name used in the code, the original reference, the sample period used in the original reference, the sign of the factor ("1" means "long", "-1" means "short"), and whether the original reference found the factor to be significant ("1" means "yes", "0" means "no"). For example, the first value factor "at_me" goes long stocks with high values of assets-to-market and shorts those with low values (and would be done the reverse if the sign was "-1" instead of "1").
